

PRODESO® Drain Membranes

Decoupling membranes optimised for internal and external environments - (PRODESO® Drain 4 & PRODESO® Drain 8)

Many tiled floor failures are not caused by the tiles themselves, but by what happens beneath them. Movement, moisture and sound transmission all place stress on a rigid tiled finish, particularly where floors are exposed to changing conditions or multiple occupancies.

The PRODESO® Drain system is designed around a single core principle: protect the tiled surface by controlling what happens underneath it. PRODESO® Drain 4 and PRODESO® Drain 8 share the same system design and decoupling logic, but are optimised for different environments. Drain 4 is configured for internal applications where sound reduction, installation speed and waterproof continuity are critical. Drain 8 applies the same system principles externally, adding active drainage to manage water in exposed conditions. In both cases.

The result? more robust, predictable and durable tiled installation.

Decoupling for Long-Term Protection

Separates the tiled surface from the substrate, helping to accommodate movement and reduce stress transfer into the tiles.

Faster, More Predictable Installation

Simplified installation logic reduces labour time, drying delays and on-site variability.

Solid Structure - No Cavities to Fill

Unlike many structured membranes, the Drain system requires no cavity filling, resulting in faster installation, reduced adhesive usage and consistent support beneath the tiles.

Designed as Part of a Complete System

Fully compatible with Proband waterproofing and other Progress Profiles system components, ensuring continuity and coordination across the full build-up.

PRODESO® DRAIN 4 – Internal Applications

Sound control, speed and protection

PRODESO® Drain 4 is designed for internal tiled floors where impact sound reduction, waterproof continuity and installation efficiency are required.

- Excellent impact sound reduction performance
- Solid, cavity-free structure for faster installation
- Reduced adhesive consumption
- Fully integrates with Proband/Profoil Pro for a complete waterproof internal system

Ideal for: apartments, multi-storey buildings, refurbishments and sound-sensitive internal environments.

PRODESO® DRAIN 8 – External Applications

Drainage, durability and edge protection

PRODESO® Drain 8 applies the same system design to external environments, adding active drainage to manage water beneath the tiled surface.

- Integrated drainage structure to control water beneath tiles
- Decouples tiles from the substrate to manage thermal movement
- Fully integrates with Proband/Profoil Pro for external waterproofing
- Works hand-in-hand with ProTerrace Double Drip to manage water at the perimeter

Together, the membrane and profile provide a highly effective solution for balconies, terraces and façades, managing water both beneath the tiles and at the edge of the installation.

Ideal for: balconies, terraces, façades and other exposed tiled areas.

One system. Correctly applied. PRODESO® Drain 4 and Drain 8 are not different products - they are the same system, optimised for internal and external environments to deliver the right performance in the right place.
